Hoisting accessories

Cabinets are often shipped with the complete electrical equipment installed, which can represent a significant weight.

If the cabinets are hoisted by the eyebolts, the stiffness of the whole structure is of paramount importance to guarantee safety and integrity; the more so with modular cabinets, where the length and weight of the system cannot be foretold in advance.

The inherent stiffness of the modules has been designed by Ilinox using a complex dimensioning and simulation process, in cooperation with the Mechanical Department of the local University.

In order to guarantee the necessary ruggedness for combination of modules, specific accessories are available.

Hoisting bars realized with strong steel pipe are available, equipped with sliding hooks, so

as to find the perfect balance of load.

Hoisting staffs can be supplied in different lengths (capacity 600 kg/m)
