RFID system

The electrical cabinet usually contains highly critical equipment, whose maintenance, upgrade and traceability is essential for the life of the plant.

Relevant documentation is usually contained in the cabinet, maybe in an appropriate pocket in the inner side of the door.

With this solution access to the information is immediate; but the documents are subject to early deterioration and to difficulties of update.

Ilinox provides a totally innovative solution. *Each* of its floor standing cabinet is supplied with an RFID tag (smaller cabinets n request), which contains a unique identification of the cabinet.

Ilinox also supplies an appropriate reader and a software application.

The reader identifies the cabinet, and the software app retrieves all stored files linked to that particular cabinets.

The apps is available for PC and for most available tablets.

The maintenance operator can retrieve any data (electrical drawings, software listings, configuration files, operating procedures, manuals, etc...) without possibility of mistake or of loss.

The technical service can update and maintain the documentation centrally, and any new access will return only the latest version of documents.
