Stainless steels parts

They say that a chain is just as strong as its weakest link.

The same is certainly true of stainless steel cabinets. The resistance to rust, the reliability, the degree of protection, the cleanliness of the surfaces are limited by the performance both of the large surfaces and of small details.

This is why Ilinox puts the same amount of care in small details as in the body of the cabinets.

A whole range of stainless steel particulars create a big difference from most competition.

Keyholes are one of the most delicate moving parts of the cabinets. A stainless steel pin and two o-rings guarantee mechanical resistance, cleanliness and washability, and perfect tightness.

Hinges are another possible weak spot of cabinets. They are very near the outer environment, and have an important role in ensuring the stiffness and

degree of protection of the enclosures. That's why Ilinox only uses microfusions in stainless steels for its hinges.

Even "low value" accessories, such as cable glands, hoisting eye-bolts, screws, handles, etc. are all available in stainless steel.
